# TIE OFF.

**FALLS KILL MORE CONSTRUCTION WORKERS THAN ANYTHING ELSE. A CITY MEANS TOWERS. EVERY DECK ABOVE ZERO IS A FALL.**

THE 6-FOOT RULE

## AT 6 FEET, YOU NEED FALL PROTECTION.

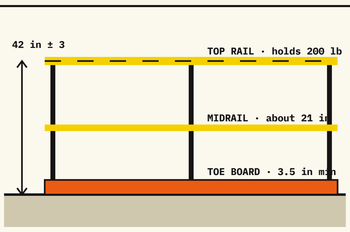

Any edge, hole or opening where you could fall **6 feet or more** to a lower level needs a guardrail, a safety net, or a personal fall arrest system. Scaffolds start at **10 feet**. On this site, Deck 1 and above always counts.

| 6 ft | 10 ft | #1 |
|---|---|---|
| FALL PROTECTION REQUIRED | SCAFFOLD FALL PROTECTION | KILLER IN CONSTRUCTION |

Just revived? Fail the balance check and you stay at Deck 0 until Med Bay clears you.

## GUARDRAILS

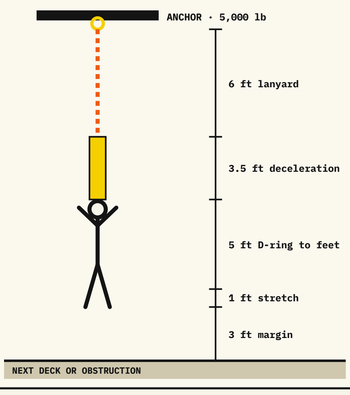

FIRST CHOICE. PROTECTS EVERYONE, EVERY TIME.

- **Top rail 42 inches** above the walking surface, plus or minus 3 inches.
- Top rail must hold **200 lb** of force pushed outward or down without failing.
- **Midrail about halfway** (around 21 inches), or mesh or screen that fills the gap.
- **Toe board at least 3.5 inches** tall wherever tools or material can be kicked off the edge.
- Removed a section to land a load? **Tie off** until it's back. Then put it back.
- Never lean on, sit on or climb a guardrail. Never hang a load from one.

## FALL CLEARANCE

KNOW HOW FAR YOU'LL DROP BEFORE YOU CLIP IN

**18.5 ft**
CLEARANCE NEEDED BELOW THE ANCHOR

- **Free fall: 6 feet max.** Anchor at or above your D-ring so the lanyard can't let you drop farther.
- **Deceleration: up to 3.5 feet** while the shock absorber tears open.
- Add your body below the D-ring (about 5 ft), harness stretch (about 1 ft) and a 3 ft margin.
- **Less than 18.5 ft below?** A 6 ft shock-absorbing lanyard will hit the deck or steel before it stops you. Use a self-retracting lifeline (SRL) instead.
- **Anchors:** 5,000 lb per worker attached, or designed by a qualified engineer with a 2:1 safety factor. Never anchor to guardrails, conduit, pipe or a load.
- Swing fall: an anchor off to the side swings you into structure. Anchor overhead.

## FALL ARRESTED

Hanging in a harness cuts off blood flow from the legs. **Suspension trauma** can make a conscious worker pass out in minutes and can kill.

**NO RESCUE PLAN, NO CLIMB.**

Your crew lead names the rescue method and the rescue gear before anyone goes up. Waiting for Fire & Rescue to arrive from the Hub takes too long.

1. **Ch 1: "Emergency, emergency, emergency. Fall, worker suspended"**, with sector-grid and deck.
2. **Talk to them.** Keep them calm and moving their legs. Have them stand in their relief straps or push against the structure.
3. **Run the rescue plan now:** rescue ladder, lift, rescue descent device or haul system. Don't wait for medics.
4. **Once down, lay them flat.** Treat as a trauma patient. Watch breathing.
5. Take the harness and lanyard out of service. Tag it. It goes to Safety for inspection.

## HARNESS CHECK, EVERY USE

- **Webbing:** no cuts, frays, burns, weld spatter holes, chemical stains or hard, glazed spots.
- **Stitching:** no pulled or broken threads.
- **Hardware:** D-rings and buckles not bent, cracked or pitted. Snap hooks lock and close by themselves.
- **Lanyard:** shock-absorber pack intact. Torn pack or red indicator showing = it already caught a fall.
- **Fit:** chest strap mid-chest, leg straps snug enough for a flat hand under them, D-ring between your shoulder blades.
- Any doubt: tag it out. Draw a new one from the Quartermaster.

## LADDERS

| 4:1 | 3 ft | 3 |
|---|---|---|
| UP 4, OUT 1 | ABOVE LANDING | POINTS OF CONTACT |

- Set the base 1 foot out for every 4 feet up.
- Extend the rails 3 feet above the landing, and tie the top off.
- Always 2 hands and a foot, or 2 feet and a hand. Carry tools on your belt or haul them up.
- Face the ladder going up and down. Never stand on the top two rungs of a stepladder.
- Metal ladders conduct and get hot. Fiberglass near power. Gloves on sun-baked rungs.

## HOLES

- Every floor hole gets a **cover or a guardrail**.
- Covers hold **twice** the heaviest load that could cross them: workers, equipment, material.
- Secured so wind, equipment or feet can't shift them.
- Marked **"HOLE"** or **"COVER"** in paint or on the cover.
- Never lift a cover you didn't set. Tell your lead.

## DROPPED OBJECTS

- A wrench dropped from Deck 10 can kill someone at Deck 0.
- **Tool lanyards** on every hand tool used at height.
- Toe boards and netting on open edges.
- **Exclusion zone** roped off below overhead work. Nobody walks through it.
- Never throw anything down. Lower it.

## WIND LIMITS

**Site rule.** Ch 16 Atmospheric posts wind at every structure.

- **25 mph sustained or gusts to 35:** no work on open steel, roofs or swing stages.
- **Blowing sand:** goggles and respirator on, or come down.
- **Continuous siren:** clip in, make safe, climb down, go to shelter.
- Loose material at height gets tied down before you leave it.

## HEAT AND HEIGHT STACK UP

A harness traps heat against your body. Steel decks and beams pass **158°F** in direct sun and burn skin in about a second. Heat dizziness at Deck 0 is a stumble. At Deck 12 it's a fall.

- Gloves and full coverage for any work on sun-baked steel. Kneel on a pad.
- Water and shade on the deck you're working on, not 12 decks down.
- Dizzy, cramping or confused? Clip in, sit down, call your buddy. Come down with help. (Module 3)
- Climbing counts as heavy work on the WBGT table.

## STOP-WORK AUTHORITY

**Every worker on this site can stop work** when someone is working at an edge without protection, a guardrail is down, a hole is open, or there is no rescue plan. Stop it, make it safe, tell your crew lead.

## WORKER ACKNOWLEDGEMENT

I know the 6-foot rule, I can inspect and fit my harness, I know how to figure fall clearance, and I will not climb without a rescue plan.
